

ENGINE MOUNT

Two engine mounts on each side of the engine and one engine mount at the back of the transmission are provided.

- Aluminum front No.1 engine mounting brackets are used for reducing weight, vibration, and noise. Furthermore, engine mounting dampers are used for reducing vibration and noise during idling.
- The front engine mounting insulator is a liquid-filled double-orifice type that reduce vibration and noise.
- By covering the rear mount with a heat insulator made of rubber, heat resistance and durability are enhanced.
